💻 Slice 19: Pipeline Form and Job Picker UI

This slice implements the user interface (UI) components for listing, creating, and editing **Pipelines**, leveraging the backend structure established in Slice 18. This is the first tangible feature for the end-user.

1. New Components and Routing

Component	Purpose	Location in Code
PipelineListPage	Lists all Pipelines, supporting searching, sorting, and actions (Edit/Delete)[1].	New Component [2]
PipelineForm	The main form for Pipeline CRUD operations, including a dynamic step manager[3].	New Component [4]
PipelinePage	Acts as the router for the /dashboard/pipelines/:id and /new routes [5].	New Component [6]

2. Pipeline Form (PipelineForm) Details

This is the core configuration component, based on the PipelineCreateSchema.

- **General Details**: Allows setting the **Pipeline Name**, **Description**, **Active Status** (Switch) [77], and **Trigger Type** (Schedule or External)[8].

- **Step Manager**: Handles the dynamic array of steps (steps array) [9999].
    - **Add/Remove Steps**: Buttons allow adding new steps and removing existing ones[10101010].
    - **Job Selection**: Each step features a Select component populated dynamically with available **Job Definitions** (using api.getJobs()) [11].
    - **Conditional Run**: Supports selecting the basic flow control: Always Run or Only if Step N Succeeded [12].
    - **Ordering**: The Execution Order field is automatically maintained and read-only[13].
- **Validation**: Uses the zodResolver with PipelineCreateSchema, ensuring at least one step is configured[14].

3. User Experience (UX) Enhancements

A key part of this slice is enhancing the context of existing components to reflect the new entity.

Location	Enhancement	Value Proposition
Job List Page (JobListPage)	A new **Pipeline Usage** column is added to the DataTable[1515].	Users can immediately see if a Job is a component of an active Pipeline, which is crucial context before editing or deleting it [16161616].
Pipeline List Page	The list view displays the **Name**, number of **Steps**, **Trigger Type**, **Active Status**, and **Creator** [17].	Provides a central overview of all orchestrated workflows.
